

1. Draw a Point Pattern

Use `GL_POINTS` to draw **10 points** arranged in the shape of a star.

2. Draw a House Using Lines

Use `GL_LINES` to draw a simple 2D house consisting of a square body, triangular roof, door, and window.

3. Draw a Triangle

Use `GL_TRIANGLES` to draw an equilateral triangle. Give each vertex a different color.

4. Draw a Rectangle Using `GL_QUADS`

Use `GL_QUADS` to draw a rectangle and experiment with changing its width and height.

5. Draw a Polygon Using `GL_LINE_LOOP`

Use `GL_LINE_LOOP` to draw a **hexagon**. Try changing the number of vertices to create different polygons.

6. Draw a Continuous Shape Using `GL_LINE_STRIP`

Use `GL_LINE_STRIP` to draw a **zig-zag pattern** with at least 8 vertices.

7. Draw a Five-Pointed Star

Use `GL_LINE_LOOP` to draw a five-pointed star. Calculate or manually define the 10 required vertices.

8. Create a Gradient Rectangle

Use `GL_QUADS` and assign a different color to each vertex so that OpenGL interpolates the colors across the rectangle.

9.Create a Triangle Strip Pattern

Use GL_TRIANGLE_STRIP to create a simple **ribbon/wavy strip** using at least 8 vertices.

10.Recreate a Simple Icon Using Multiple Primitives

Create a simple **traffic light / smiley face / tree** using at least **3 different OpenGL primitives** from the list. For example, use points for details, lines for outlines, and triangles/quads for filled shapes.
